

Student Project - S07

Title	Underground Multi-Storey Car Park System
Abstract	This project forms an ideal solution to the congested parking problem in Hong Kong. The whole carpark goes underground, and it will not use up valuable space on the road. This fully automatic underground car park can identify the smart card parking ticket, automatically transport and store the car to an empty car park slot. It can also retrieve the car back automatically when the driver wants to get the vehicle back.
